Skin Searcher

Find flashy, colorful Roblox avatars for your recordings - automatically.

It searches Roblox for you, asks an AI to pick out avatars that stand out (a strong look, a standout hat or accessory, bold colors), skips famous accounts, and saves each keeper as a picture named after the player. You then take the username and use your usual copy-avatar command.

Set up once (about 5 minutes)

1

Get the files

Open **github.com/tomasfi2006-del/skin-searcher**, click the green **Code** button, then **Download ZIP**. Unzip it somewhere easy, like your Desktop.

2

Install Python (skip if you have it)

Download it from **python.org/downloads**. On Windows, tick **"Add python.exe to PATH"** on the first installer screen - this is the step people miss.

3

Get a free Gemini key

Go to **aistudio.google.com/apikey**, sign in with a Google account, and click **Create API key**. Copy it. It's free - you don't need a card.

4

Open the program

Windows: double-click **start.bat**. **Mac:** double-click **start.command** (if it refuses, open Terminal in the folder and type `python3 catalog.py`).
The first launch installs one small helper automatically. Then choose **7** in the menu and paste your key. It's checked, then saved on your computer only.

> **That's it.** From now on you just double-click start.bat / start.command and pick a number. Your key, settings and avatars are stored in the **catalog** folder and are never uploaded anywhere. To get new versions later, double-click **update.bat** - it keeps that folder untouched.

The menu

Everything is one screen. Type a number and press Enter. Press **Ctrl+C** at any time to stop - whatever was found so far is kept.

```
============================
        SKIN SEARCHER
============================
  212 avatars saved | 1,430 people checked

  1) Find avatars in groups   (best)
  2) Find avatars by keyword  (slower)
  3) Save specific usernames
  4) Review avatars in a grid  (teach it your ta
  5) Open the avatars folder
  6) Settings
  7) Change Gemini API key
  0) Quit
```

What you'll see
The top line shows how many avatars are saved and how many people have been checked (the numbers here are just an example).

Best way to start
Choose **1** and type `outfits fashion`. Outfit and fashion groups are full of people who care about their look, so a much bigger share of them are keepers than in random search.

Option	What it does	What to type
1 Groups	Pulls members out of Roblox groups and judges their avatars. Fastest and best results. Skips groups that hide their member list automatically.	Group search words (`outfits fashion drip`) or group ID numbers - the number in a group page's web address.
2 Keywords	Uses Roblox's user search, like typing *boy* or *yellow* into the search bar. Roblox only allows 1 search per minute, so it's slower.	Search words: `boy yellow red neon`
3 Usernames	You found someone yourself? Saves their avatar directly. No AI, no key needed.	Usernames, with or without @: `Cone_phonky @Shark_Vibess`
4 Review	Opens every saved avatar in a grid in your browser. **Click one to copy its username**, or rate it: **Perfect** / **Dislike** - the AI learns from your ratings.	Nothing
5 Open folder	Opens the folder of saved pictures.	Nothing
6 Settings	Change the limits on the next page.	A number
7 API key	Paste a new Gemini key. It is hidden while you type and tested first.	Your key

Where the results go

Every keeper is saved as **catalog/avatars/PlayerName.png** - the file name *is* the username. The easiest way to browse them is menu option **4**: click an avatar to copy its username, then paste it into your copy-avatar command. Don't like one? Delete its file (option **5** opens the folder). It won't come back, because that person is remembered as already checked.

What it looks for

The AI was tuned on 20 avatars you picked by hand. In the first real test, about **85%** of what it saved were ones you'd keep (28 of 33). It saves an avatar when it stands out and has personality:

- a standout hat, headpiece or signature accessory
- a clear character or theme - costume, fantasy, anime, a joke (famous characters are fine)
- bold color: strong saturated colors, a rainbow, or a striking one-color / black-and-white look
- a fun or quirky touch - a text shirt, silly face, props, effects

It rejects plain or default-looking avatars and ones piled so high with items that the look is hard to read. By default it never saves an account with more than **500 followers**, so you don't end up copying a well-known player.

> **Teach it your taste.** It's an AI judging by eye, so a few saved avatars won't be to your taste. Open menu option **4** and press **Dislike** on them (pick a reason if you like) and **Perfect** on the ones you love. Every later search shows the AI examples of both, so it gets closer each time. The menu shows your "% kept" score so you can watch it improve. Avatars you save by hand (option 3) count as Perfect automatically.

Settings (menu option 6)

Setting	Default	What it means / when to change it
Skip accounts with more followers than	500	Lower = only very unknown players. Raise it if you don't mind slightly more popular ones.
New people to check per group	300	How many new people to judge from each group per run. Higher = longer run, more results.
Groups to use per group search word	3	Typing *outfits* uses the 3 best-matching groups.
People to pull per keyword	100	For keyword mode. 100 is the most Roblox gives per search.
Avatars per Gemini request	10	Leave this alone unless you see AI errors. 10 makes the daily limit go 10x further.

How fast, and the limits

Limit	What happens
Gemini free tier: 15 requests/min and 500/day per model	The program alternates between two models and judges 10 avatars per request - roughly **60 avatars a minute** and about **10,000 a day**. You'll almost never hit it.
Roblox user search: 1 per minute	Only affects option 2. Another reason groups (option 1) is the better choice.
Daily limit reached	It stops cleanly, keeps everything, and tells you. Come back the next day.

> **Why runs get faster and better over time:** everyone checked is remembered (catalog/seen_users.json), so running the same groups again skips old faces and digs deeper into the member list. To start completely fresh, delete that one file.

Something not working?

What you see	What it means / what to do
"Python is not installed"	Install it from python.org/downloads and tick **Add python.exe to PATH**. Then double-click start.bat again.
The window flashes and closes	Always open it with start.bat (Windows) or start.command (Mac), not by double-clicking catalog.py.
"That key didn't work" / "Gemini rejected your API key"	Choose **7** and paste a fresh key. Make sure you copied all of it, with no spaces.
"member list is hidden without logging in"	Normal. Some groups hide their members from logged-out visitors. It skips to the next matching group by itself.
"not judged (retried next run)"	Google's AI was busy for a moment ("high demand"). Nobody is lost - just run it again and those people are checked then.
"...out of quota for today"	You've used the day's free AI allowance. Everything found is saved. Try again tomorrow.
"*name*: not found"	A username typo, a banned account, or a renamed player (option 3).
Almost nothing new is found	Those groups are mostly checked already. Try different group words (*drip*, *aesthetic*, *avatar*) or a different group ID.
Mac says the file can't be opened	Open Terminal, drag the folder into it after typing `cd ` , press Enter, then run `python3 catalog.py`.

Pro tips

- **Start a run before you go do something else.** A big group run is a few minutes; you can walk away and just come back to the folder.
- **Use several different group words** in one go: `outfits fashion drip aesthetic anime`.
- **Found a great avatar in a group?** Search that group's name or grab its ID - similar people hang out there.
- **Keep your key private.** Don't paste it in chats or send the catalog folder to anyone; the key is stored in `catalog/gemini_key.txt`.

For power users - command line

Everything in the menu also works with options, so you can script it or run it on a schedule:

```
python catalog.py --groups outfits fashion
python catalog.py --groups 5215595 --per-group 500
python catalog.py --keywords boy yellow red
python catalog.py --usernames Cone_phonky Shark_Vibess
python catalog.py --groups outfits --max-followers 200
python catalog.py --gallery
python catalog.py --help
```

With no key saved, set it for the session first: Windows `set GEMINI_API_KEY=your-key`, Mac/Linux `export GEMINI_API_KEY=your-key`.
